

H₂O 5FT WATER BARRIER

Absorbs, Contains & Diverts Water

How to Stack Water Barriers

- Self-activating flood barriers—water activated, no sand or labor needed
- Contains a super absorbent polymer that reacts and swells on contact with water
- Holds up to 4.25 gallons of water
- Contains, controls and diverts flood water with built-in anti-roll wedge
- Safe, non-toxic, eco-friendly and reusable for ongoing protection
- Stack in pyramid formation to increase wall height and protection
- Not for use with salt, calcium, lime or chlorine

HOW TO USE

- Place the **H₂O 5FT WATER BARRIER** in the path of oncoming water.
- As the water barrier comes in contact with water, it will absorb through the material and begin to swell.
- **H₂O 5FT WATER BARRIER** contains a wedge to prevent them from rolling. When laying in position, be sure to place the “mini channel” away from flooding water. This will assure that as it grows, it acts as a wedge to secure in position.
- Place wider section of the barrier towards water, as the smaller section (wedge) prevents it from rolling.
- **How to Stack:** Place the first two barriers with wedge on top of wedge and then add a third barrier on top for a stable wall.
