

QUICK RINSE

Mop Cleaning System

CODE # P9251

The **QUICK RINSE** mop cleaning system circulates clean water without any harsh chemicals to flush away dirt and provides a more sanitary cleaning. **QUICK RINSE** keeps your mops smelling better, helping them last longer and reducing mop head expenses.

DIRECTIONS

- If using hose wye connector or splitter, screw it onto your faucet.
- Place **QUICK RINSE** pail directly in bottom of mop sink, making sure drain spills into basin.
- Connect the water hose from hose wye connector to rinse pail.
- Turn on the water source. Hot water is preferred but cold will do.
- Once the **QUICK RINSE** pail is full and water is flowing out the drain, plunge mop up and down in **QUICK RINSE** pail until water is clear, approximately 2-3 minutes.
- Place clean mop into traditional mop bucket with cleaning solution and proceed to mopping.
- Each time the water needs to be changed, pour out dirty water from your traditional mop bucket and repeat the process of cleaning the mop in the **QUICK RINSE** pail.
- No soap or solution should go in the **QUICK RINSE** pail. It is created to rinse everything out of the mop, including soap, dirt and debris, resulting in a clean mop like one that is new or freshly laundered.
